Serial port and communication protocol

§1.1 outline

The new CAM-3000 series products have built-in isolated RS485 interface, support many communication protocol at same time, including MODBUS protocol, M-BUS protocol, FUJI extending protocol, compatible with HUIZHONG company products communication protocol.

MODBUS protocol is regular factory control protocol, our meters support the two formats of MODBUS:RTU AND ASCII.

M-BUS is commonly used heat meter measuring protocol internationally, users using this protocol choose "MODBUS ASCII" in M63.

Hipeak FUJI extending protocol is developed based on Japan FUJI ultrasonic flow meter protocol, compatible with FUJI ultrasonic flow meter protocol, and the 7 version ultrasonic flow meter protocol.

Compatible protocol is compatible with hipeak water meter protocol and HUIZHONG company products communication protocol, in order to make users conveniently connect CAM-3000 series products to developed data collecting system by users according to other national manufacturers communication protocol, our products can support 12 kinds of compatible communication protocol, users need to choose "MODBUS" ASCII" in M63, and then choose any protocol listed.

CAM-3000 series products can act as the fuction of simple RTU equipment, using current loop and OCT output to control marching type or analogue electromagnetic valve opening, OCT output can control power on/off of other devices, its 1 channel analogue input is used to input signals of pressure, temperature, etc.

When the setup item in M63 is "MODBUS-RTU ONLY", it is used to support MODBUS-RTU protocol. when the item is "MODBUS ASCII+previous protocol", it is used to support MODBUS ASCII. Meter-BUS, hipeak FUJI extending protocol and Huizhong flow meter, water meter compatible protocol.

Also using M63 to choose different Huizhong flow meter, water meter compatible, to choose after choosing "MODBUS-RTU", "MODBUS-ASCII"

Setup serial port parameters in M62,8 kinds of supportable baud rate: 19200,14400, 9600, 4800, 2400, 1200, 600, 300 . stop bit:1 baud or 2 baud.check bit is optional.

Using self-equiped standard MODBUS drivers of differents Supervisory Control and Data Acquisition can conveniently connect CAM-3000 to data acquisition.by using MODBUS-PROFIBUS converter, it can conveniently connect CAM-3000 to PROFIBUS.using RS485 to connect RS485 bus.it is also available to use GSM message module board made by us, transferring flow rate/heat quantity measuring datas through message.the module board can multimachine network, and use mobile phone to check the work status and measuring datas of flow meter.

When using in network environment, except that programming address identification number (IDN) on parallel port or serial port keyboard, other operations can be done on upper monitor.

Data output adopts command-respond method, that means upper monitor send an command, the flow

meter respond correspondingly.

Flow data collecting can use commonly used flow rate/heat quantity data monitor system developed by our company,the system sufficiently used software and hardware design of flow meter features,based on features of CAM-3000 flow meters,has advantages of cost-effective,simple and quick,reliable operation,etc.

There are many third party manufacturers who have data collecting software that support specially CAM-3000 series flow meters for users to use, some small softwares are free for users to network to conveniently adjust communication, the new version of CAM-3000 designed a simulated operating status, so to simulated work to adjust without connecting flow meter with pipe.

§1.2 questions and answers about communication

- (1) question: why it is unavailable to connect flow meter? no any respondence after connecting? answer: A. check whether the serial port parameters are matching, whether choose the right protocol in M63.
 - B. whether phisical wiring is good or not.
 - C. power on again, there should be a character "AT", otherwise, there is problem in A and B procedure.
 - D. check the command is correct or not.when using extending protocol,<ENT> character should be after the command.
 - E: whether the setup of address in M46 is right or not.
- question: the reading datas of MODBUS is like a mess that is not in accordance with displaying datas
 - answer: normally if MODBUS protocol can read datas, that means there is no problem for the protocol, the datas in a mess is because of follow existing errors.
 - A. data format is wrong;
 - B. Register address is wrong ,that results in datas shifting to create errors.
 - For example:REAL4—this real(float floating point numbers of IEEE754 format),there are 4 different alignments according to word and byte,the kind used in TDS100 is the most regular,ie low word and high byte format.you can modify data store format of your software to solve this problem.if use common used Supervisory Control and Data Acquisition,it has a method of choosing format.
- (3) question:my system require sending one command per hour receive many variables at same time, which protocol should be used?
 - answer: One MODBUS command can read lots of variables one time.if MODBUS-RTU can not solve this problem, use hipeak extending protocol connected by joint mark of "&",or use simple compatible protocol or Meter-Bus protocol.
- (4) question:reading measurement value by protocol is not in accordance with the displaying value on flow meter?
 - answer: A. Onfirm the variable address is the variable that you want or not? There are too many variables inside flow meter, whether confused or not? when reading datas, REG 0001 represent 0000 in order character string, not 0001.0001 represent the content of reading REG 0002 in command character string.

B. For totaliser value, it only display 7 binary decimal digits, by MODBUS protocol, it can read 8 binary decimal digits. so the last 7 binary are the same.

(5) question:my system can not support long integers and real format, what should I do?

Answer: need to adopt data conversion mode, or look for new drivers to solve.

(6) question:does MODBUS have testing program?

Answer:has!recommand to use MODSCAN software,search it on the internet.the program is convenient,helpful to check reading datas,understand the meaning of all kinds of datas.

(7) question: if the flow meter has simulated operating status to test conveniently, how to setup?

Answer: has!input "0" in M11 to start simulated operating status.under this status,setup flow velocity to be 1.2345678m/s,instant flow rate is 0,and display "R" status.if there is requirement for the flow rate to be set value,then input a minus set value in M44.for example:input -3600m³/s,the instant flow rate will display 3600 m³/s.at this time,all the totalisers will accumulate correspondingly.thus obtain variable totaliser output.using this function,without connecting the transducers,conveniently to adjust with networking software and test the function of the flow meter.

(8) question: when using C,how about the floating point storage sequence?

Answer:for example: 3F 9E 06 51 four byte is IEEE754 format float floating point of 1.2345678.the sequence of MODBUS data flow is 06 51 3F 9E, No. 1 address data flow should be 01 03 04 06 51 3F 9E 3B 32 (hexadecimal digits) ,using C language in X86 computer,storage sequence from low to high according to internal storage is 51 06 9E 3F.

For example:read two register command of REG25,REG26 of net totaliser as follows:

01 03 00 18 00 02 44 0C(hexadecimal digits).return data should be (set net totaliser=802609,its 4 byte hexadecimal digits is 00 0C 3F 31) 01 03 04 3F 31 00 0C A7 ED(hexadecimal digits,A7 ED is checksum)

§1.3 MODBUS protocol

It can support the two formats of MODBUS.to choose MODBUS-RTU format or MODBUS-ASCII format in M63.default format is MODBUS-ASCII.

CAM-3000 series ultrasonic flow meter/heat meter can only support three fuction codes of MODBUS:03,06,16.respective fuction is reading register, writing single register and data block.

:

For example:in the method of RTU,read the flow velocity of No.1 equipment,read register of 5,6,that is two registers.command as follows:

01 03 00 04 00 02 85 CA (hexadecimal digits)

(Equipment number) (function) (start register) (register number) (checksum)

85 CA is **hexadecimal digits, obtained by algorithm of CRC-16**(BISYNCH, polynomial is $x^{16} + x^{15} + x^2 + 1$, mask word is 0A001H). for detailed algorithm, pls refer to information about MODBUS.

returned datas should be (set status is simulated operating, flow velocity =1.2345678m/s)

01 03 04 06 51 3F 9E 3B 32 (hexadecimal digits)

Equipment number function data byte data=1.234567 checksum

Four bytes of 3F 9E 06 51 is IEEE754 format float floating point of 1.2345678

another example, read net totaliser flow, two registers of REG25, REG26, command as follows:

01 03 00 18 00 02 44 0C (hexadecimal digits)

returned datas should be(set net totaliser=802609,its 4 byte hexadecimal digits is 00 0C 3F 31)

01 03 04 3F 31 00 0C A7 ED (hexadecimal digits, A7 ED is checksum)

When net totaliser=0, returned data is 01 03 04 00 00 00 00 FA 33

FA 33 is checksum.

Pls note the above datas storage sequence.when explaining datas by C language, use pointer to put the needed datas to corresponding variable address.normal storage sequence is that low byte is in front.for above example: 1.23456m/s, storage sequence of 3F 9E 06 51 data is 51 06 9E 3F.

In ASCII mode, read No. 1 equipment, 10 register commands start from register 1 are as follows:

: 0103000000AF2 (ENTER)

In MODBUS-RTU mode,read 125 registers mostly each time.but in MODBUS—ASCII mode,read only 61 registers,if more than the figures,the flow meter will return error message.for more details,pls refer to information about the MODBUS protocol.

When adjusting MODBUS protocol,recommend to use a free adjustment software-MODSCAN, this software can be found on internet. when there is problem, but can receive check and correct data packet, so that the communication has no problem.

In default state, communication setup: velocity is 9600, no check, 8 data bit, 1 stop bit.

§1.3.1 MODBUS register address table

(note the difference with water meter protocol)

register	Numbe rs of register	Variable name	Data type	discription	
0001-0002	2	Instant flow rate	REAL4	unit: m³/hour	
0003-0004	2	Instant heat flow rate	REAL4	unit: GJ/hour	
0005-0006	2	fluid velocity	REAL4	unit: m/s	
0007-0008	2	measuring sound velocity of fluid	REAL4	unit: m/s	
0009-0010	2	positive totaliser flow	LONG	all the flow totalisers that use long integers, its measure is controlled by M32(REG1438)	
0011-0012	2	positive totaliser flow decimal part	REAL4	REAL4 is standard IEEE-754 format float floating point.the format data is also called FLOAT format.	
0013-0014	2	negative totaliser flow	LONG	Long integers is lower digit in front and with character	
0015-0016	2	Negative totaliser flow decimal part	REAL4		

0017-0018	2	positive totaliser heat quantity	LONG	all the heat quantity totalisers that use long integers,its measure is controlled by M84(REG1441)
0019-0020	2	positive totaliser heat quantity decimal part	REAL4	
0021-0022	2	negative totaliser heat quantity	LONG	
0023-0024	2	negative totaliser heat quantity decimal part	REAL4	
0025-0026	2	net totaliser flow	LONG	
0027-0028	2	net totaliser decimal part	REAL4	
0029-0030	2	net totaliser heat quantity	LONG	
0031-0032	2	net totaliser heat quantity decimal part	REAL4	
0033-0034	2	temperature 1/supplying water temperature	REAL4	unit: °C
0035-0036	2	Temperature 2/return water temperature	REAL4	unit: °C
0037-0038	2	analogue input AI3 value	REAL4	converted dimensionless data
0039-0040	2	Analogue input AI4 value	REAL4	converted dimensionless data
0041-0042	2	Analogue input AI5 value	REAL4	converted dimensionless data
0043-0044	2	Analogue input AI3 current value	REAL4	unit: mA
0045-0046	2	Analogue input AI4 current value	REAL4	unit: mA
0047-0048	2	Analogue input AI5 current value	REAL4	unit: mA
0049-0050	2	system setup password	BCD	writable ooth represents to cancel password setup
0051	1	hardware setup password	BCD	writable o "A55Ah" represents openning
0053-0055	3	date and time of the instrument	BCD	writable 6 byte BCD respectively represent second ,minute,hour,date,mont h,year,lower bit is in front.
0056	1	automaticaly store data day,hour	BCD	writable ^o 2 byte represent scheduled storage data starting time and day,for example:0312H represent the storage datas of the third day and the twelve O'clock each month.0012H represents storage datas of the twelve O'clock each day.
0059	1	input key value(analogue	INTEGER	writable.refer to manual key value

		keyboard)		list.
0060	1	make screen display x number Menu	INTEGER	writable.
0061	1	input backlit light time	INTEGER	writable unit:second
0062	1	Buzzer' beeping times left	INTEGER	writable. The mostly 255 times
0062	1	OCT pulse number left	INTEGER	writable. The mostly 65536
0072	1	instrument work error code	BIT	16 bit respectively represents
				following meanings in remark 4
0077-0078	2	supply water resistor number	REAL4	unit:ohm
0079-0080	2	return water resistor number	REAL4	unit:ohm
0081-0082	2	total transfer time of ultrasonic	REAL4	Unit:ms
0083-0084	2	ultrasonic transfer time difference	REAL4	Unit:ns
0085-0086	2	ultrasonic upstream trasfer time	REAL4	Unit:ms
0087-0088	2	ultrasonic downstream transfer time	REAL4	Unit:ms
0089-0090	2	present current loop output current value	REAL4	unit:mA
0092	1	Work procedure and signal quality	INTEGER	high byte represents signal adjustment step,low byte represents signal quality,data range:0-9,high data represent good signal
0093	1	upstream signal strenghth	INTEGER	Data range:0-4095
0094	1	downstream signal strenghth	INTEGER	Data range:0-4095
0096	1	operating interface language type	INTEGER	0 represent Chinese, 1 represent English
0097-0098	2	ultrasonic signal transit ratio	REAL4	Normal range:100+-3%
0099-0100	2	present reynolds number	REAL4	
0101-0102	2	present reynolds correction coefficient	REAL4

				installed on supply water pipe
				BIT3=0 represent heat meter
1.451		12	DEAL	installed on return water pipe
1451	2	user scaling factor	REAL4	1:0:11
1521	2	factory scaling factor	REAL4	unmodifiable
1529	2	equipment electronic serial	BCD	this equipment electronic serial
		number		number
				high bit is in front.

Remark: (1)inside total flow used combined method by long integers and decimal.when using,read long integers is ok without decimal part.total flow size and total unit and multiplier factor have

relations, assumed that long integers part of total flow is N(for positive total flow, it is the digit of register 0009,0010,32 bit with character long integers), decimal part of totaliser flow is Nf(for positive total flow, it is the digit of register 0011,0012,4 byte floating point), multiplier factor of total flow is n(register 1439), then positive total flow= $(N+Nf) \times 10^{n-3}$ (unit is comfirmed in register 1438 of total flow unit)

in register 1438,the meaning of data 0-7 is as follows:

0 cubic meter (m3)

l litre (L)

2 US gallon (GAL)

3 imperial gallon (IGL)

4 US Mega gallon (MGL)

5 cubic feet (CF)

6 US oil barrel [42](OB)

7 imperial oil barrel (IB)

Totaliser flow= $(N+Nf)\times 10^{n-4}$

include: for net heat quantity, N is in the register of 0029, 0030

for neat heat quantity, Nf is in the register of 0031, 0032

n is confirmed in the register of 1440.

totaliser heat quantity unit is confirmed in the register of 1441.

- (2) not supply other variables, if you need, pls consult our factory.
- (3) Pls note that lots of datas in above table are not valid for non heat meter, using flow meter solely, you can ignore the irrelevant term, these irrelevant terms are to unify our products' communication protocol, convenient for users to use.
 - (4) error code is 16 bit, the meaning is as follows:

Bit0 error of no receipt of signal

Bit1 error of lower signal

Bit2 error of poor signal

Bit3 error of empty pipe

Bit4 error of circuit hardware

Bit5 adjusting current gain

Bit6 over range error of frequency output

Bit7 error of the current that current loop output is over range(normaly need to setup max

range)

Bit8 verification error of inside data register

Bit9 master frequency or clock frequency exists error

Bit10 parameter block exists checksum error

Bit11 program memory data checksum error

Bit12 temperature measuring circuit possibly exists error

Bit13 reserved

Bit14 error of inside timer overflow

Bit15 analogue input circuit exists error

Attention:if used in flow meter, pls shield the bit related with heat quantity measurement before using these codes, because the status of the bit are not assured.

§1.3.2 year, month, day total data MODBUS address table

day total datas(the address are not the same with that of other vision flow meter)(注意与其它版本流量计的地址是不同的)

Each day tatal data adopts data block of 32 byte to store circulation, totally 512 data blocks, the pointer address of present data block is in register 0162, the data range: 0~511. present pointer point to the data of "yesterday", present pointer minus 1, it point to "the day before yesterday". when the data pointer equal to 0, and minus 1, it point to data block 511. set the digit in register 0162 is 1, then, total datas of yesterday is in register of 10257-10272, the data of the day before yesterday is in register of 10241-10256, the data of three days ago is in register of 18417-18432.

Attention: in Supervisory Control and Data Acquisition, need to add "4" before the variable reading of floating point etc.so as to fill register address in this kind of software, the register of 10241 should be "410241"

address table is as follows:

Data	register address	piece	name of variable	data type	introduction
block		s of			
numb		regist			
er		er			
n/a	0162	1	day total data	Integer	data range:0-127
			pointer		
	10241	1	status byte and day	BCD	lower byte is status, higher byte

					511

remark: 1. Status byte meaning refer to the introduction

2. If all the read data is OFFH, that means the register is empty.

(2) month total data(the address are not the same with that of other vision flow meter)

Structure of month total data is the same with day total data,pls refer to introduction of day total data.especially the data of date byte is always 0,has 128 data blocks.

Address table is as follows:

Data	register	pieces	name of variable	data type	introduction
block	address	of			
numb		register			
er					
n/a	0163	1	month total data	Integer	data range:0-127
			pointer		
	8193	1	status byte	BCD	lower byte is status, higher byte
					is 0
0	8194	1	month and year	BCD	lower byte is month,higher

127	10225-10240	16			the data block of the number 127

remark: 1 Status byte meaning refer to the introduction

^{2.} If all the read data is OFFH, that means the register is empty.

³ Year total datas are exported from month total datas.

§1.3.3 power on/off data MODBUS address table

When power off,TDS16 flow meter can record the time of power off and work status of flow meter at that time and all totalisers value, each data block is comprised of 128 byte, totally has 32 pieces data block, circling record last 32 times power off. system utilize these datas to restore the flow meter to the work status before power off, users can check by using these datas.

Store the datas of power on/off by using queue ring structure,note that the present position of datas are related with pointer, and the difference compared to day, month, year total datas is that the pointer minus 1 can point to the datas of power on/off, refer to day totaliser instroduction part, the address table of MODBUS of power on/off datas is as follows: (the address is not the same with that of other vision flow meter)

Data block numb er	register address	pieces of register	name of variable	Data type	introduction
n/a	0164	1	power on/off data pointer	Integer	data range0-31
	6145	1	second and minute of power on	BCD	lower byte is second,higher byte is minute

§1.4 hipeak FUJI extending communication protocol

CAM-3000 new version ultrasonic flow meter can also use hipeak series the seventh version TDS7—FUJI extending protocol.in following table, the red command is new added protocol.in this protocol, the transferred datas are ASCII codes to check and debug.

Applied in the system that sending one command but need many datas, use the character of '&' to connect many basic command together to form one compound command to send one time.refer to the introduction of the character of '&' in the following part.

command	Meaning of the command	Data format
DQD(cr) remark 0	return instant flow per day	±d.ddddddE±dd(cr) remark 1
DQH(cr)	return instant flow per hour	±d.ddddddE±dd(cr)
DQM(cr)	return instant flow per minute	±d.ddddddE±dd(cr)
DQS(cr)	return instant flow per second	±d.ddddddE±dd(cr)
DV(cr)	return instant fluid velocity	±d.ddddddE±dd(cr)
DI+(cr)	return positive total flow	±dddddddE±d(cr) ^{remark 2}
DI-(cr)	return negative total flow	±dddddddE±d(cr)
DIN(cr)	return net total flow	±dddddddE±d(cr)
DIE(cr)	return heat quantity total flow	±dddddddE±d(cr)
DIE+(cr)	return positive heat quantity total flow	±dddddddE±d(cr)
DIE-(cr)	return negative heat quantity total flow	±dddddddE±d(cr)
DIT(cr)	return today net total flow	±dddddddE±d(cr)
DIM(cr)	return this month net total flow	±dddddddE±d(cr)
DIY(cr)	return this year net total flow	±dddddddE±d(cr)
DID(cr)) return instrument ID code(address code)	ddddd(cr) 5 bits
E(cr)	return instant heat flow per second	±d.ddddddE±dd(cr)
DL(cr)	return signal strength	UP:dd.d,DN:dd.d,Q=dd(cr)
DS(cr)	return percentage data of analogue output AO	±d.ddddddE±dd(cr)
DC(cr)	return present error code	Remark 3
DA(cr)	OCT or RELAY alarm	TR:s,RL:s(cr) ^{remark 4}
DT(cr)	present date and time	yy-mm-dd,hh:mm:ss(cr)
Time@TDS1=(cr)	Set date and time yy-mm-dd,hh:mm:ss	
M@(cr)	Send to CAM-3000 analogue key assignments	M@(cr) ^{remark 5}
LCD(cr)	return present displaying content of LCD monitor	
LOCK0(cr)	unlock(new added command)	unrelated with original password
LOCK1(cr)) lock(new added command)	

MENUXX(cr)	display directly skip to Menu XX	
LANGUAGEX(cr)	choose interface language	X=0 English, 1 simple chinese
		2 italy, if available
		3 korea, if available
		4 franch, if available
		5 german, if available
		6 spanish, if available
BAUDRATEX(cr)	Change band rate (data bit $= 8$, no	_
, ,	verification, stop bit=1)	14400,
	•	9600,4800,2400,1200,600,300
C1(cr)	OCT actuation	
C0(cr)	OCT disconnect	
R1(cr)	RELAY actuation	
R0(cr)	RELAY disconnect	
FOdddd(cr)	make frequency output to output by n	Fdddd(cr)(lf)
	value	
Aoa(cr)	make current loop output the current	AOa(cr)(lf) ^{remark 6}
	value a	
BA1(cr)	return the resistor value of temperature	±d.ddddddE±dd(cr)(lf)
	Т1	
BA2(cr)	return the resistor value of temperature	±d.ddddddE±dd(cr)(lf)
	T2	
BA3(cr)	return current value of AI3 (0~20mA)	±d.ddddddE±dd(cr)(lf)
BA4(cr)	return current value of AI4 (0~20mA)	±d.ddddddE±dd(cr)(lf)
BA5(cr)	return current value of AI5 (0~20mA)	±d.ddddddE±dd(cr)(lf)
AI1(cr)	return T1 value of temperature	±d.ddddddE±dd(cr)(lf)
	input(temperature)	
AI2(cr)	return T2 value of temperature	±d.ddddddE±dd(cr)(lf)
	input(temperature)	
AI3(cr)	return AI3 value of analogue	±d.ddddddE±dd(cr)(lf)
	input(temperature,pressure,etc)	
AI4(cr)	return AI4 value of analogue	±d.ddddddE±dd(cr)(lf)
	input(temperature,pressure,etc)	
AI5(cr)	return AI5 value of analogue	±d.ddddddE±dd(cr)(lf)
	input(temperature,pressure,etc)	
ESN(cr)	return ESN	ddddddt(cr)(lf)remark 7
UINFO=user data(cr)	input the command of displaying user	The user display Menu content will
	display information in [M][0][.],behind	keep unchanged until power off.
	with 40 byte user data	
N	single byte address networking command	Remark 8
	prefix	
W	numeric string address networking	Remark 8
	command prefix	

P	with verification feedback command	
	prefix	
&	use the character of '&' to connect many	added length of characters are not
	basic commands together to form one	over 253 bytes.
	compound command to send one time	
RING(cr)(lf)	modem ask handshake command	ATA(CR)(lf)
OK(cr)	modem answer signal	No output,
	flow meter ask handshake signal	AT(CR)(LF)

	special command A	
GB(cr)	GSM short message communication	Remark 9
	special command B	
GC(cr)	GSM short message communication	Remark 9
	special command C	

remark:

- 0. (cr) represents carriage return, the ASCII code is 0DH_o (lf) represent newline, the ASCII code is 0AH_o
- 1. d represent digits of $0\sim9$, 0 means +0.000000E+00
- 2. d represent digits of 0~9, ddddddd is integer, the integer without decimal point before "E".
- 3. Characters of 1~6 means instrument status, meaning of the characters refer to error codes, for example "R", "IH"
- 4. s means one of ON/OFF/UD

For example: "TR:ON,RL:ON" represent OCT and RELAY are in actuation status For example: "TR:UD,RL:UD" represent OCT and RELAY are not used.

- 5. @ represents key assignments, for example :30H represent "0"key, the command : "M4" correspond to "4" key.
- 6. a represent current value, range :0~20, for example:AO2.34567, AO0.2
- 7. dddddddd (eight byte)represent instrument ESN, t represent instrument type
- 8. If there are many new version CAM-3000 flow meters in data network, the basic commands can not be used alone, you must add N or W prefix firstly, otherwise result in answering by many flow meters at same time, confuse the system.
- 9. Use GSM module to connect flowmeter, so can have the fuction of using mobile phone short message to check the flow parameters of the flow meter

§1.4.1 function prefix and function character

(1) P prefix

Add character P in front of every basic command,that represents returned datas have CRC verification.checksum is obtained by binary system addition.

for example: command DI+ (CR) (corresponding binary system data is 44H,49H,2BH,0DH) returned data is +1234567E+0m3 (CR) (corresponding binary system data is 2BH,31H,32H,33H,34H,35H, 36H,37H,45H,2BH,30H,6DH,33H,20H,0DH,0AH),then command PDI+(CR) returned data is +1234567E+0m3 !F7(CR), "!"represent it is summation character before it,and two byte checksum behind it ,(2BH+31H+32H+33H+34H+35H+36H+37H+45H+2BH+30H+6DH+33H+20H=(2)F7H)

There could be no datas before "!", possibly exist blank space character also.

(2) N prefix

The method of N command is N + single byte address code + basic command .

For example:to visit the instant fluid velocity of flow meter No.88, send command 'NXDV'(CR), decimal system code value of X is 88 o Recommend users to use W command o

(3) W prefix

The method of W prefix is W+numeric string address code +basic command, numeric string data range: 0~65535 exclude 13 (0DH carriage return), 10 (0AH newline), 42 (2AH *), 38 (26H&). ito visit the instant fluid velocity of flow meter No.12345, send command W12345DV(CR), corresponding binary system code is 57H,31H,32H,33H,34H,35H,44H,56H,0DH.

(4) '&' function character

The function of '&' can achieve to add together many basic commands, only ensure that the formed total character after all basic commands added is not over 250 characters. the formed super command can be sent to flow meter one time, the flow meter answers at same time.

(5) P prefix, P could be added in front of basic commands .

For example:require to return at the same time the No 4321 flow meter's 1. instant flow 2. instant fluid velocity 3. positive total flow 4. heat quantity total flow 5. AI1 analogue input current value 6. AI2 analogue input current value, with verification, send the commands as follows:

W4321PDQD&PDV&PDI+&PDIE&PBA1&PAI2(CR)

returned data at the same one time is possibly as follows:

- +0.000000E+00m3/d!AC(CR)
- +0.000000E+00m/s!88(CR)
- +1234567E+0m3 !F7(CR)
- +0.000000E+0GJ!DA(CR)
- +7.838879E+00mA!59
- +3.911033E+01!8E(CR)

for example, require to modify the outside pipe diameter to be 123.456mm through serial port, then return monitor content, send commands as follows:

MENU11&M1&M2&M3&M:&M4&M5&M6&M=&LCD (CR)

§1.5 compatible communication protocol

Compatible communication protocol is easy to use for users to connect CAM-3000 with developed data acquisition system according to HUIZHONG communication protocol.new developed project do not need to use these protocols, because we will invent new meters that could not support these protocols.

New CAM-3000 can support 8 kinds of Huizhong communication protocol now.

In order to use Huizhong communication protocol, users need to choose "MODBUS" ASCII" in M63, then choose one of followings.

```
0. CRL-G ; LL=113 byte
1. SCL-61D (D<50mm) ; LL=13 byte, cumulant decreased 1000 times</li>
2. SCL-61D (D≥50mm) ; LL=13 byte, cumulant decreased 10 times, (default options)
3. SCL-6
4. SCL-7x(D<50mm) ; LL=13 byte, cumulant decreased 10 times</li>
5. SCL-7x (D≥50mm) ; LL=13 byte, cumulant decreased 10 times
```

6. CRL-G-DL (D<50mm) : LL=13 byte, cumulant decreased 1000 times 7. CRL-G-DL(D≥50mm) ; LL=13 byte, cumulant decreased 10 times

8. CRL-H ; LL=33 byte, cumulant decreased 1000 times

9. CRL-HL ; LL=33 byte, with negative total heat quantity, cumulant decreased

1000 times

10. CRL-G-D (D<50mm) ; LL=33 byte, cumulant decreased 1000 times 11. CRL-G-D (D≥50mm) ; LL=33 byte, cumulant decreased 10 times

12. SCL-61DT (D<50mm) $\,$; with temperature LL=17 byte, cumulant decreased 1000 times

13. SCL-61DT (D≥50mm); with temperature LL=17 byte, cumulant decreased 10 times

14. SCL-71x(D<50mm) ; LL=13 byte, cumulant decreased 10 times

15. SCL-73x (D≧50mm) ; LL=13 byte,cumulant do not decrease or increase

D represents pipe diameter in above protocol

Recommend to use MODBUS for new developed project.

Other detailed information refer to Huizhong information.the following is the introduction of SCL-61D(D≥50mm),the battery powered water meter manufactured by us is only compatible with this protocol,so new version flow meter take this protocol as default options.

§1.5.1 SCL-61D(D≥50mm) compatible protocol

interface: RS485

baud rate: default: 9600, to choose 8 kinds of velocity in M62

check bit: (NONE), (EVEN), (ODD)

data bit: 8 stop bit: 1, 2

Introduction in the followings:XXh represents present meter communication address(network address),data range: 00h-FFh. YYh represents new meter's communication address,data range: 00h-FFh.ZZh is checksum,is byte cumulative sum of all the data bytes(attention:it is binary system cumulative sum,not include control and command byte),not count carry bit part that is over FFh.h represents the data is **Hexadecimal**

command format

 $(1) \ \ read\ water\ meter\ data\ \ (4A\ command)$

mainframe command: 2Ah XXh 4Ah meter answer: 26h XXh 4Ah LL (BCD code) ZZh

contents of LL (BCD code) are as follows:

position	content	byte	introduction
		number	
1~4	instant flow	4	decrease 1000 times to actual data, unit:m3/h
5~8	positive total flow	4	decrease 10 times to actual data , unit:m3
9~12	total operating time	4	Unit:hour
13	diagnose information	1	refer to diagnosis information table
	code		

(2) read scheduled time storage data (49 command)

mainframe command: 2Ah XXh 49h meter answer: 26h XXh 49h LL(BCD 码) ZZh

This command can read datas of water meter like (1)4A, the only difference is that the read datas of this

command is the datas of last scheduled time storage, but the read datas of (1)4A is present datas of water meter.

(3) change communication address (4B command)

mainframe command: 2Ah XXh 4Bh YYh meter answer: 26h XXh 4Bh YYh

if choose that XXh=YYh, this command can cycling check whether the communication line is normal or not,scan the meter numbers in network,realize network autolayout.

Attention:normally,need to confirm wether the mainframe setup the right communication address.if no checking,in high bit error rate network,be cautious to use this 4B command,because if the mainframe send YYh that occurs error,then will "loose"lower computer,or make two meters have the same communication number that occurs confliction.

(4) change(setup) scheduled time data memory time(4C command)

mainframe command: 2Ah XXh 4Ch DDh HHh

meter answer: 26h XXh 4Ch DDh HHh MMh ZZh

DDh represents some day, HHh represents some hour, MM represents some minute, BCD code format Get the data of DD as a day of some month, for example: 2Ah 86h 4Ch 12h 15h means the number of 86 meter memorize(store) present instant flow, total flow, work time and status code at 15 O'clock, 12/each month, the stored datas can be read out by using 49 command.

If DD=0,that means to memorize(store) at HHh O'clock everyday.

(5) broadcasting timing (4D command)

mainframe command: 2Ah AAh 4Dh ssmmhhDDMMYY meter do not answer ssmmhhDDMMYY represent time,date datas in BCD code format,respectively is second,minute,hour,day,month,year.

Diagnosis information code: 00h represents work normally

02h represents pipe empty error or work abnormally.

05h represents data storage error, hardware trouble, need to repair.

(6) extensional read water meter command (50 command)

mainframe command: 2Ah XXh 50h (*xxP) meter answer: 26h XXh 50h LL (BCD code) ZZh contents of LL (BCD code) as follows:

position	content	byte	introduction
		numbers	
1~4	instant fluid velocity	4	compact BCD code, decrease 1000 times to be actual
			data ,unit: m/h
5~8	instant flow	4	compact BCD code, decrease 1000 times to be actual
			data , unit:m3/h
9~12	positive total flow	4	data part that compact BCD code represents, unit:m3
13~16	negative total flow	4	data part that compact BCD code represents , unit:m3
17	total flow product	1	Data range:N=0~6
	coefficient value		0, 1, 2, 3, 4, 5, 6 respectively correspond to the unit:
			1, 0.1, 0.01, 0.001, 0.0001, 0.00001, 0.000001 m3
18~21	total operating time	4	compact BCD code, unit:hour
22	diagnosis information	1	refer to diagnosis information table
	code		

for example: $9\sim12$ byte data is 12h, 34h, 56h, 78h, but the 17 byte digit =2, actual positive total flow value is $12345678 \times 0.01 = 123456.78 \text{ m}^3$

```
instant flow velocity=00000.090 m/s instant flow rate=00000.065 m3/h positive total flow=78563412x10-<sup>3</sup>=78563.412 m3 negative total flow=12345680x10-<sup>3</sup>=12345.680 m3 total work time=00001234 hour water meter work status=00 represents it is normal.
```

attention:the users who need to replace, upgrade, pls notice following points:

- (1) New version CAM-3000 series products emphasize that uesers can program and change,so in the protocol, there is no stable baud rate and check bit defination, users need to check by yourself, adopt suitable baud rate.
- (2). When New version CAM-3000 series ultrasonic flow meter communicating, little requirement for time, collect datas at any time.no special requirement for the interval time of collecting data.
- (3) the default baud rate of new version CAM-3000 series ultrasonic flow meter before leaving factory is 9600,no check bit.if need to replace similar meters,require to change serial port parameter.users can require the factory to setup before leaving the factory when placing an order.users can change them by yourself.
- (4) You can check and visit the Communication address (communication number) of New version CAM-3000 series ultrasonic flow meter in M46,modify them by keys also the address code is set to be 01 before leaving factory, users can modify to suitable address.

1.6 M-BUS protocol

(1) outline

Version CAM-3000 2.00

Communication protocol of New version CAM-3000 battery powered lower consumption series ultrasonic flow meter/heat meter uses M-BUS communication protocol format, a new European Standard, suitable to all meters networking, refer detailed information to www.m-bus.com. M-BUS module adopt twisted pair that can transfer datas and supply power to meters that are all connected with bus and can be different types meters.

Each new version CAM-3000 battery powered lower consumption series ultrasonic flow meter/heat meter is equiped with software part of M-BUS protocol before leaving factory.but users have to order the hardware module part of M-BUS solely.

In most application conditions, the software part of M-BUS is completely used in RS232 bus and RS485 bus.

(2) M-BUS features

about hardware part

about software part

(3) interface

new version CAM-3000 battery powered lower consumption series ultrasonic flow meter/heat meter has following different hardware configuration according to different types,or users'requirements.

- (A) RS-232 interface(configured).
- (B) RS-485 interface(configured).
- (C) Optic electric interface adapter board:equiped with meter reader with optic electric interface to read inside parameters conveniently.
- (D) M-BUS adapter board: using single twisted pair line to realize bi-directional data communication and supply power to meters.

message format:adopt Eropean standard IEC 870-5-1

baud rate: 300/1200/2400/4800/9600/19200/14400 baud

check bit: odd pariry,no parity,even parity

data format: changeable length ,multibyte data,lower byte is in front.(mode 1)

(4) detaied information

- (A) the seeking of dharma of check and CS: from C domain to the first byte before checksum,8 bits cumulative sum of all bytes,not include carry bit
- (B) Address FDh(following h suffix represents hex. System)is used for address extended to the second address, FEh and FFh address is broadcasting address, FEh address need answer from slave machine, but FFh address need not answer.
- (C) If there are many slave machine with the same first address on the bus, it will has confliction, and the current and voltage of M-BUS bus will change abnormally, the mainframe can use this abnormal change, assist "cancel selection" "choose the second address" etc. messages to solve the confliction problem automatically .normally, M-BUS can realize to redistribute the address automatically
- (D) Do not use those manufacturers'special mainframe command that is used by users rarely.because these commands can make meters work abnormally.
- (E) Notice that the M-BUS protocol of CAM-3000 meters is not the same with that of imported products protocol from other countries.

(5) software protocol

Detailed introductions of M-BUS protocol refer to DIN EN1434-3, further detailed informations refer to "The M-BUS: A Documentation" that can be obtained from the websit www.m-bus.com

Message format of new version CAM-3000 lower consumption industry water meter/ultrasonic flow meter is variable format.and heat meter and water meter adopt the same protocol, when users do not need the heat datas, just throw away unwanted datas, or adopt following common used reserved data message, choose the wanted datas.

new version CAM-3000 lower consumption industry water meter/ ultrasonic flow meter support following functions:

- * support the second M-BUS addressing visit
- * can modify the first M-BUS address
- * can change date and time
- * support modify meter work parameters online

detaied protocol is as following table

(attention:some uncommon used variable of M-BUS message are incomplete)

Table 1 from mainframe=> to slave machine protocol message format

mainframe request	forma	ıt										introduction	slave	machine

remarks: * choose the second address,can use asterisk wildcard that can make the mainframe find the all slave machines on the bus quickly.

^{**} setup the mode for compatible standard, because TYPE F does not have second, so these two messages setup second= $0 \circ TYPE$ F format is the date/time format M-BUS specified \circ

§1.7 key assignments coding

Key assignments coding is used when networking, analogue keys function on upper machine. for example: input command "M1" through serial port, that equals to press key "1" of the keyboard of CAM-3000 ultrasonic flow meter, so achieve to operate all fuctions of keyboard on upper machine completely. all keys coding are as follows:

Key number	Key assignment code (hexadecimal)	Key assignment code (decimal system)	ASCII code	key	Key assignment cod (hexadecimal)	Key assignment cod (decimal system)	ASCII code
0	30H	48	0	8	38H	56	8
1	31H	49	1	9	39H	57	9
2	32H	50	2	•	ЗАН	58	:
3	33H	51	3	◀	3BH	59	;
4	34H	52	4	MENU	3СН	60	<
5	35H	53	5	ENT	3DH	61	=
6	36H	54	6	▲/+	3ЕН	62	>
7	37H	55	7	▼/-	3FH	63	?

§1.8 programming example

- VB send sentence of inquiry instant flow per second MSCOMM1.INPUT="dqs"+vbcrlf;
- 2. using VB to send command, require to return back to No.4321 flow meter at same time: 1. instant flow 2. instant flow velocity 3. positive total value 4. total heat quantity5. All analogue input current value 6. Al2 analogue input digits with verification send commands as follows:

MSCOMM1.INPUT="W4321PDQD&PDV&PDI+&PDIE&PBA1&PAI2"+VBCRLF;

3. using VB to send command to modify the setup of outside pipe diameter (in M11) to be 345mm.

MSCOMM1.INPUT = "M<"+VBCRLF+"M1"+VBCRLF+"M1"+VBCRLF+"M3"+VBCRLF+"M4"+VBCRLF+"M5"+VBCRLF+"M6"+VBCRLF+"+VBCRT+"+VBCRT+"+VBCRT+"+VBCRLF+"+VBCRT+"+VBCRT+"+VBCRT+"+VBCRT+"+VBCRT+"+VBCRT+"+VBCRT+"

Remark: "M<"represent MENU key, "M="represent ENT key, "M1"represent"1"
